Structural Comparison of SSO and VED Asymmetries

Proposed comparison of rate and closure differences; no typed translation is established.

$$\Delta v \to 0 \iff \Delta C \to 0 : \text{synchrony / closure}$$
$$|\Delta v| \text{ too large} \iff \Delta C \to \Delta C_{max} : \text{rupture / disconnection}$$

Boundary comparisons above are schematic, not logical equivalences or calibrated translations.

Historical symbols are retained; the two descriptions do not ground or validate one another.
