Fig.5 Three Examples of VED-Defined Emergence

A proposed formal-role comparison across three distinct domains

Proposed reading: lower-layer motion + mutual constraint → upper-layer attractor

$U = \Phi(L, H_{ij})$

Physics / Standard Model

lower layer L

causal logs C_i

internal vectors e_i

↓

mutual constraint H

closure condition

closure energy E(A)

↓

upper layer U

particle-like attractor

Life / Bio-IFGT

lower layer L

information flow J

state evolution F(x; θ)

↓

mutual constraint H

DNA-derived θ

non-equilibrium exchange

↓

upper layer U

life attractor Ω_{life}

Intelligence / Part II

lower layer L

recursive log layer L_R

inference traces and re-entry

↓

mutual constraint H

observer-environment H_{ij}

projection of stopping regions

↓

upper layer U

emergent stopping layer L_E

VED-defined emergence

$U = \Phi(L, H_{ij})$

schematic comparison, not a typed identity or shared-mechanism result

The arrows compare formal roles; they do not derive one domain from another.
