

Two Modes of Convergence Toward the Differential Horizon

差の地平線への二つの接近経路

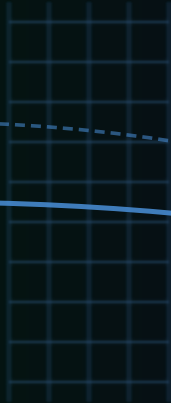

Spatial Convergence

Scale ↓

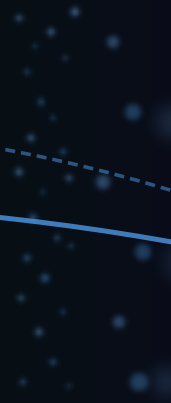

Quantum / QFT / Planck limit

large scale structure

increasing fluctuation
loss of spatial definability

Differential Horizon

Transition Band

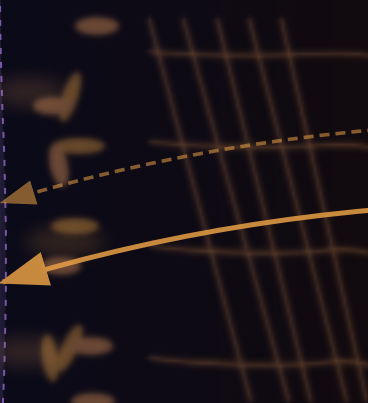

boundary
contact

divergence

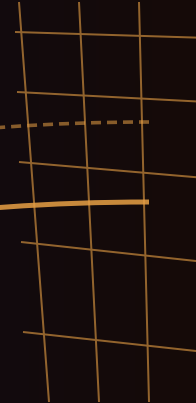

Temporal Convergence

Velocity ↑

Relativity / c-limit / Black hole

increasing energy density
loss of temporal definability

normal spacetime

Different trajectories, same boundary.

Two distinct routes of physical convergence approach the same differential horizon.

Spatial convergence proceeds through scale reduction and increasing fluctuation.

Temporal convergence proceeds through increasing velocity and the collapse of temporal duration.

Though their trajectories differ, both terminate in divergence as boundary contact.
