Scoped support, roles and regimes

From accepted r1 (impl55; material advisories); SVG grants no authority; analytical template; no empirical certification. Roles are not object types. No formation, convergence or autonomy claim. Current role view v0.1; legacy architecture retained separately; audit, release, source, deployment states: external records by file hash. Scope/window: Unknown (unset). Roles and sides are scope/window-relative. Open bracket: analytical boundary, not physical enclosure or subject. Each assessment/path: support, scope/window, criterion, recipient, evidence/status. Shared fields, separate values. Unsupplied fields: Unknown (unset). See assessment/path and status keys below. LE needs independent criteria. Feedback availability is necessary, not sufficient, in scope.

Register trace: not support creation. Trace ref Unknown.

Re-reference: availability is not use/effect.

Tracked retention support

Handle/tracking policy/identity-continuity witness: Unknown Access/persistence: Unknown. Access loss is not support loss. Resurfacing: reassess identity and role.

Attached role vocabulary: not current assignment

LR: retained trace role, not all generated history.

LE: quasi-stable retention role; not permanent or stopping evidence.

LE': temporary scaffold regime of same LR support, not a new object.

Support-view port

Assessment A: role Unknown

Assessment B: role Unknown

Reassessment: arrowless A/B relation. Same-support link Unknown; not a state transition.

Update/inference activity, not a support

Externalize: carrier/persistence Unknown; no assured storage.

Environment/shared support Outside view

Re-enter: carrier Unknown; not effective return.

Activity input

Activity reference

Feedback: availability is not observed effect. ? Link/effect Unknown (unconfirmed)

Recipient/target: Unknown

Shown paths, provenance and reassessments are conditional samples; criterion, evidence and identity unconfirmed. Solid path: model-supported (witness required); dashed: conditional. Status meanings below. Verb + endpoint kinds give type, not status. Arrowless: noncausal relation. Gap + ?: link Unknown. Separate identity, access, persistence, path availability, use and effect. Unknown links stay Unknown. Reassessment allows weakening/stabilization; not a ladder, timeline or reversible law.

SUPPORTED IN DECLARED MODEL Criterion ref/witness required; not empirical validation.

CONDITIONAL MODEL ASSIGNMENT Reference declared assumptions; not observed.

NOT SUPPORTED UNDER CRITERION Criterion-local; not global absence or permanent not-LE.

? UNKNOWN Give reason (unset, unobserved, etc.); not false, absent or not-LE.

Copy: source support to distinct destination support. Distinct handle; same bytes are not same support; no role inheritance.

Transform: before-view to after-view. Identity Unknown; tracking policy/witness required, not automatic same/new.

Components-of: component refs and composite ref (distinct handle). Non-directed; not a composition operator or LE formation law.

Equal analytical scopes: no capability, ownership or progress assignment. Each scope: declare recipient, retention, re-entry and rule responsibility, or Unknown. Runtime retention is not model-native. Shared support does not establish AI autonomy. Scope expansion does not create a subject; artifact origin does not determine ownership. Support, role, regime, system and ownness differ. Ownness describes direction, persistence, target, control, reuse and effects only; no score or binary owner.

Transformer only

Model + runtime

Human-tool / shared environment
